Business Requirements & Process Design

Document ID	**BRD-ERP-001**
Revision	1.0
Status	ILLUSTRATIVE — NOT APPROVED FOR OPERATIONS
Audience	Business Owner, Procurement, Regulatory, IT, QA, Data Governance
Information classification	Synthetic portfolio exercise; no employer or customer data

Scenario: A fictional business consolidates five legacy datasets into a new ERP staging environment. All systems, transactions, personnel and results in this document are synthetic.

1. Purpose and measurable objective

Define business and data-quality requirements for migrating vendor, material, order, regulatory and pricing records from five hypothetical legacy applications into the AtlasERP staging environment. The end state supports accurate vendor onboarding, purchasable material status, invoice matching, regulatory launch readiness, and traceable exception resolution.

Illustrative acceptance objectives—not historical business results: 100% of critical records have traceable source IDs, all blocked records remain excluded from release, no unresolved Sev-1/Sev-2 defects at go-live, and 98% or greater accuracy on sampled noncritical mapped fields. These are proposed targets requiring sponsor approval.

2. Stakeholders, responsibilities and approvals

Role	Accountability	Evidence generated
Business Product Owner	Approves requirements, priorities and final business acceptance	Signed UAT acceptance decision
Procurement / Supplier Management	Verifies vendor identity, terms and approved supplier state	Supplier correction approvals
Regulatory	Confirms product country/market restrictions and launch data	Regulatory requirements sign-off
Order-to-Cash / Finance	Validates order, credit and payment references	Order reconciliation evidence
Data Engineering	Builds transformation, loads staged records, provides logs	Job logs, mapping-version evidence
QA / Test Lead	Plans testing, verifies evidence and defect closure	Executed scripts and defect register
Security / Privacy	Reviews roles, sensitive data handling and access	Least-privilege assessment

3. Scope and exclusions

- In scope: entity-level profiling; source-to-target mapping; duplicate detection; invalid value handling; exception workflow; role-based review; test transfer approval; business-user instructions; end-to-end UAT.
- Out of scope: live SAP access, actual customer account changes, production cutover execution, implementation of bank/credit-card processing, or a regulatory compliance certification.

4. Current-state and future-state workflow

CURRENT: Procurement verifies vendor identities in Legacy A; Manufacturing uses material attributes in Legacy B; Customer Operations works from orders in Legacy C; Regulatory tracks market rules in Legacy D; Finance maintains price and payment terms in Legacy E. Users exchange spreadsheet reconciliations and manual queries.

FUTURE: Extracts flow into a landing zone, are profiled and transformed using version-controlled mappings, then validated in AtlasERP staging. Failed records receive an exception ID, an assigned business owner, and a documented disposition. Only approved records move into the accepted dataset; final production deployment is outside this portfolio example.

5. Functional requirements

ID	Requirement	Acceptance criteria
FR-001	Preserve source lineage	Each target record stores source system and original record ID
FR-002	Standardize vendor identifiers	Supplier ID conforms to VND-#### and duplicate groups are logged
FR-003	Validate material-to-vendor associations	Inactive/unapproved vendors cannot be selected for new materials
FR-004	Retain regulatory market status	Restricted items remain flagged by market at all stages
FR-005	Reconcile staged purchase orders	Order counts and amounts agree within documented tolerance
FR-006	Capture exception decisions	Each exception records field, owner, severity, date and disposition
FR-007	Honor role permissions	Viewer cannot edit vendor approvals; approver action is logged
FR-008	Support operational reporting	Dashboard reports open exceptions, age, accuracy and throughput

6. Nonfunctional requirements

- NFR-001: Auditability—source, transformation version, reviewer, timestamp and decision are preserved in test evidence.
- NFR-002: Confidentiality—access limited by role; demo materials contain only generated vendor names and records.
- NFR-003: Recoverability—rejected load does not overwrite the last accepted staging snapshot.
- NFR-004: Accessibility—tables have meaningful headings; procedural steps are written in plain language.

7. Data governance and exception decisions

Define a single authoritative owner for each field. Vendor approval comes from Procurement; material status from QA/Manufacturing; regulatory market eligibility from Regulatory; price and terms from Finance. When source systems disagree, do not silently pick the most recent field. Open an exception; request documentary evidence; identify the business authority; record approval; then apply a corrected mapping or source value.

8. Traceability and decision gates

Each requirement is connected to test cases in the requirements traceability matrix (RTM). The design-review gate requires approved mappings, named data owners and documented assumptions; UAT-entry requires an accessible staging build, synthetic fixtures, defect workflow and trained testers; go/no-go is decided only after evidence-based UAT exit review.

9. Open assumptions and dependencies

- Assumption A-01: The target ERP supports a custom source-lineage field. Verify with the target application team.
- Dependency D-01: Regulatory must provide the current approved market-code dictionary.
- Risk R-01: A vendor record migrated as active without a valid approval may enable unauthorized purchase; mitigate with release blocking and negative UAT tests.

10. Technical writer review notes

This sample demonstrates how a writer turns ambiguous needs into testable, numbered requirements. In a real program, the Product Owner, IT, Legal/Privacy and functional SMEs would review this document and approve controlled revisions.

REGULATORY / TECHNICAL REVIEW ADDENDUM — November 2026

Independent technical writing portfolio enhancement. Additional validation gates and examples are illustrative, not authorized production instructions. Regulated applicability varies by product, process, record and organization.

Requirements boundary and non-regulatory scope

This is an illustrative supplier, material and finance master-data ERP migration; it is not inherently a regulated GMP computerized system. FDA 21 CFR Part 11 is not automatically applicable merely because records are electronic or an ERP is used. Applicability requires an identified FDA predicate-rule record and appropriate regulated reliance on the electronic record.

For a hypothetical regulated use, document the intended use, affected records, record ownership, quality impact, risk assessment, validation/assurance strategy and retention/approval requirements. These cannot be established by an illustrative PDF alone.

Stakeholder acceptance criteria

Business owner: migrated vendor is active only if approved in source record; Procurement: legal identity and payment terms reconcile; Quality: materials use only the currently authorized vendor and specification record; Regulatory: launch readiness dates and market restrictions remain accurate; IT: error logs, transformation scripts and access controls are versioned.

Example BR-007: the application shall flag a supplier/material association that fails approved master-data matching; acceptance evidence is a failed UAT case plus logged exception and blocked downstream approval. User acceptance is a business sign-off after test evidence review, not a substitute for deployment risk approval.

Change control and training acceptance

Before approving go-live, map each affected procedure to a named owner, confirm the end-user guide is updated, record training requirements, preserve exception disposition, and obtain defined sign-offs. A draft user guide is not evidence that users have been trained.

Place unresolved critical supplier-status defects on the go/no-go list. If business accepts a lower-risk open issue, record the exception approver, expiry, impact and mitigation; do not silently convert fail to pass.

Document-specific reference basis and status

ISO/IEC/IEEE 26514:2022 information for software users (full URL in portfolio review report)

IEC/IEEE 82079-1:2019 instructions for use (full URL in portfolio review report)

FDA Part 11 scope and application guidance (full URL in portfolio review report)

W3C WCAG 2.2 color use guidance (full URL in portfolio review report)

Status: technical/editorial review against publicly available references completed at a portfolio-example level; no licensed-standard full-text conformance audit, live environment testing, site QA approval or legal certification performed.

Appendix: November 2026 standards and documentation applicability review

PUBLIC SYNTHETIC PORTFOLIO SAMPLE — This appendix records source-checking and editorial scope boundaries. It does not make the fictional organization regulated, certify a system, or replace actual company policies and competent quality/legal review.

ERP / UAT regulatory applicability and software test-evidence review

- Confirm each source-to-target mapping has an owner, approved transformation rule, exception disposition and independent tie-out. Synthetic test failures must remain OPEN until a documented rerun passes.
- Separate functional UAT from regulated computerized-system validation: business acceptance is not evidence of 21 CFR Part 11 compliance or FDA-required validation.
- 21 CFR Part 11 may become relevant only if the mapped environment maintains qualifying electronic records/signatures within predicate-rule scope; evaluate access, audit trail, record retention and copies when applicable.
- For medical-device production/QMS software, FDA's February 2026 Computer Software Assurance final guidance provides risk-based recommendations and QMSR became effective February 2, 2026; do not impose these onto a general commercial SAP migration.
- NIST access control, change management and audit logging offer voluntary security reference points for privileged ERP access, defect fix approvals and evidence retention.
- Technical writing QA: include acceptance criteria, reproducible steps, observed versus expected result, severity basis, defect owner, approval and version; never infer that an unresolved hypothetical defect passed.

Verified against published authoritative source pages as of November 2, 2026. No proprietary standards were audited clause-by-clause. Actual application must be assessed based on product, system use, region, and record type. Proposed procedures have not been executed in a production environment.

Independent second-pass document review | November 2, 2026

REVIEWED PORTFOLIO DEMONSTRATION — this appendix records a document-specific editorial and source-scope check. The main procedure and forms are fictional and not approved for production, executed testing or regulated use. Original source versions are retained as editable files in this portfolio.

A. Document-specific findings and checks

Review objective	2026 reviewer correction / expectation	Verification evidence
Scope/requirements	Map functional requirement to owner, expected data behavior, verification criteria and proposed test.	Show unambiguous pass criteria including incomplete/missing vendor records.
Security and records	Specify who may edit vendor approvals and who may view or export sensitive vendor and customer data.	Role-based permission intent is explicit; no claim of actual certified implementation.
Approval	Product/QA/IT business approval after stakeholder review and known open gaps.	Approval status remains proposed/synthetic; no fabricated legal electronic signatures.

B. Applicable regulatory / guidance boundaries

Review objective	2026 reviewer correction / expectation	Verification evidence
Scope	Fictional commercial supplier master/ERP migration, not a validated medical-device QMS or clinical EDC.	Do not label SAP-like mock UAT as an FDA validation or actual system access test.
Evidence	Requirements -> source mapping -> expected/actual result -> defect -> retest -> acceptance owner.	Use synthetic IDs, revisioned mappings and traceable test executions.
Conditional FDA applicability	Part 11 if predicate electronic records; 2026 QMSR and device CSA only if used for in-scope device production/QMS.	A business test pass never independently proves GxP compliance or authorized production deployment.

C. Evidence and sign-off boundaries

Status: Editorial second-pass reviewed; technical procedure not executed; company-specific SOP approval not obtained.

All tests, screenshots, users, suppliers, dates, IDs, incident observations, performance metrics and signatures in the demonstration are synthetic.

Next practitioner action: confirm source applicability for the actual jurisdiction and product; conduct SME/user testing and accessibility review; update controlled revision and approval fields.

No color, watermark, revision number, PDF export or reference link by itself demonstrates regulatory compliance.
