User Acceptance Test Plan & Test Execution Guide

Document ID	**UAT-PLAN-007**
Revision	1.0
Status	ILLUSTRATIVE — NOT APPROVED FOR OPERATIONS
Audience	Business Testers, QA Lead, IT, Procurement, Regulatory, Customer Operations
Information classification	Synthetic portfolio exercise; no employer or customer data

Scenario: A fictional business consolidates five legacy datasets into a new ERP staging environment. All systems, transactions, personnel and results in this document are synthetic.

1. Objective

Demonstrate that the AtlasERP staging workflow meets approved functional requirements for supplier master data, materials, orders, regulatory status and finance fields before business acceptance. Test both successful flows and failure paths using synthetic fixtures.

2. UAT roles and independence

Role	What the person does
UAT Lead	Coordinates schedule, traceability, triage, evidence completeness
Business Tester	Executes scenario, compares observed with expected, attaches evidence
Business Owner	Decides whether requirement is acceptable and signs exit recommendation
Technical Lead	Corrects code/configuration, delivers tagged build for retest
Subject Matter Expert	Clarifies source interpretation and expected business outcome

3. Entry criteria

- Approved or baseline business requirements and mapping dictionary available to all testers.
- Synthetic test data contains expected good, bad, duplicate, missing-approval and orphan records.
- Test environment identified by build number; access roles provisioned and verified.
- Execution tracker, defect register, issue triage cadence and evidence naming convention published.

4. Execution method

- 1. Read the linked requirement and expected result; confirm that the setup and test fixture are correct.
- 2. Capture environment, build ID, test case ID, run date and tester.
- 3. Follow the documented steps exactly; do not skip negative-path controls.
- 4. Compare actual outcome with expected; attach sanitized screenshot or CSV comparison.
- 5. Mark PASS only if all acceptance criteria are satisfied. Otherwise file a defect, link requirement/test IDs and mark FAIL or BLOCKED.
- 6. After remediation, retest on a new tagged build and link prior evidence; do not overwrite the original failure.

5. Detailed test scenarios

Case	Setup/actions	Expected result

TC-001	Load valid vendor VND-0001 with approved evidence	Active vendor; source lineage present
TC-002	Load VND-0042 without approval reference	Vendor blocked; EXC-003 raised
TC-003	Load material MAT-0084 linked to missing VND-0099	Material rejected; orphan exception
TC-004	Load duplicate VND-0001 with changed address	Duplicate cluster; no silent overwrite
TC-005	Load restricted product for US market	Market restriction preserved in staging
TC-006	Submit order amount 129.50 USD	Target amount 129.50; count and totals reconcile
TC-007	Load unsupported currency XXX	Reject row with documented reason
TC-008	Viewer tries to approve blocked supplier	Access denied; no status change
TC-009	Change mapping version v1 to v2 and retest	Evidence shows both versions and outcomes
TC-010	Open dashboard with three unresolved issues	Accurate counts, age and owner filters

6. Severity, priority, and triage

Severity	Definition	Example
S1	Data loss or critical unauthorized transaction path	Unapproved supplier becomes purchasable
S2	High-impact incorrect regulatory or financial data	Restricted product displayed eligible
S3	Noncritical functional defect with workaround	Filter sorting not retained
S4	Cosmetic or low-impact wording	Help text punctuation issue

Severity describes impact; priority describes fix order and may differ. The UAT Lead records decisions with business owner input, and the system owner retains technical accountability.

7. Exit criteria and reporting

- All required cases have execution evidence or an approved documented deferral.
- Zero open S1 or S2 issues; S3/S4 dispositions are approved by business owner.
- Source-to-target reconciliation is complete for required fields and entities.
- Requirement-to-test traceability is reviewed and any uncovered requirement has a documented resolution.
- Business owner signs a recommendation; no simulated signature is presented as an actual approval.

8. Reporting metrics

Track execution progress (executed/planned), pass rate (passed/executed), open high-severity defects, defect age, retest closure time, unmapped critical requirements, exception backlog, and rejected/accepted row counts. Use the included CSV files as synthetic evidence, not as historical work accomplishments.

9. Risk and escalation handling

- Blocked environment: Record impact, mark cases BLOCKED, notify Technical Lead and UAT Lead, reschedule without altering expectations.
- Unclear business rule: Pause execution, obtain SME/business owner decision, version the requirement and retest affected cases.

- Unauthorized access or sensitive data exposure: Stop test, restrict evidence, and escalate via security incident process rather than attaching raw sensitive records.

10. Sample closure recommendation

SAMPLE ONLY: As of the mock review, TC-002 remains failed due to DEF-002. Because it allows an unapproved supplier to appear active, exit criteria are NOT met. Proposed disposition: NO-GO pending fix and independent retest. No production deployment or approval is claimed.

REGULATORY / TECHNICAL REVIEW ADDENDUM — November 2026

Independent technical writing portfolio enhancement. Additional validation gates and examples are illustrative, not authorized production instructions. Regulated applicability varies by product, process, record and organization.

Repeatable execution protocol

Test setup: identify build, environment, dataset revision, tester role, access rights, preconditions, system timestamp and the requirements-to-test relationship. Use synthetic fixtures. For each case document exact steps, expected outcomes, observed actual outcomes, evidence ID, PASS/FAIL/BLOCKED result and retest status.

Example UAT-004: PRECONDITION vendor SUP-0042 is approved and SUP-0024 is inactive. ACTION load a receipt with SUP-0024 attached to controlled material RM-0078. EXPECTED system blocks release/approval workflow and logs supplier-status mismatch. FAIL if workflow permits unrestricted release. Preserve screenshot and log reference if actually executed; here the outcome is fictional.

A blocked test is not a pass or a fail. Record reason, responsible owner and necessary remediation before repeating; do not calculate success rates by dropping blocked cases from the report without explaining exclusions.

Go/no-go, traceability and defect remediation

Every critical requirement must have at least one executed passing case or documented exception approved by the appropriate business owner. A failed supplier validation control blocks go-live for the impacted process until fixed or formally risk-accepted under a defensible governance process.

Example evidence chain: BR-007 -> UAT-004 -> DEF-002 -> MAP-004 revision -> UAT-004-R1 -> go/no-go decision. The traceability matrix should make this chain visible to independent reviewers.

Business user acceptance, QA review and regulated computerized system validation are distinct activities; a UAT pass alone does not prove compliance with FDA 21 CFR Part 11.

Document-specific reference basis and status

ISO/IEC/IEEE 26514:2022 information for software users (full URL in portfolio review report)

IEC/IEEE 82079-1:2019 instructions for use (full URL in portfolio review report)

FDA Part 11 scope and application guidance (full URL in portfolio review report)

W3C WCAG 2.2 color use guidance (full URL in portfolio review report)

Status: technical/editorial review against publicly available references completed at a portfolio-example level; no licensed-standard full-text conformance audit, live environment testing, site QA approval or legal certification performed.

Appendix: November 2026 standards and documentation applicability review

PUBLIC SYNTHETIC PORTFOLIO SAMPLE — This appendix records source-checking and editorial scope boundaries. It does not make the fictional organization regulated, certify a system, or replace actual company policies and competent quality/legal review.

ERP / UAT regulatory applicability and software test-evidence review

- Confirm each source-to-target mapping has an owner, approved transformation rule, exception disposition and independent tie-out. Synthetic test failures must remain OPEN until a documented rerun passes.
- Separate functional UAT from regulated computerized-system validation: business acceptance is not evidence of 21 CFR Part 11 compliance or FDA-required validation.
- 21 CFR Part 11 may become relevant only if the mapped environment maintains qualifying electronic records/signatures within predicate-rule scope; evaluate access, audit trail, record retention and copies when applicable.
- For medical-device production/QMS software, FDA's February 2026 Computer Software Assurance final guidance provides risk-based recommendations and QMSR became effective February 2, 2026; do not impose these onto a general commercial SAP migration.
- NIST access control, change management and audit logging offer voluntary security reference points for privileged ERP access, defect fix approvals and evidence retention.
- Technical writing QA: include acceptance criteria, reproducible steps, observed versus expected result, severity basis, defect owner, approval and version; never infer that an unresolved hypothetical defect passed.

Verified against published authoritative source pages as of November 2, 2026. No proprietary standards were audited clause-by-clause. Actual application must be assessed based on product, system use, region, and record type. Proposed procedures have not been executed in a production environment.

Independent second-pass document review | November 2, 2026

REVIEWED PORTFOLIO DEMONSTRATION — this appendix records a document-specific editorial and source-scope check. The main procedure and forms are fictional and not approved for production, executed testing or regulated use. Original source versions are retained as editable files in this portfolio.

A. Document-specific findings and checks

Review objective	2026 reviewer correction / expectation	Verification evidence
Test design	Test valid, missing, duplicate, mismatched, unauthorized-edit and downstream reporting cases.	Expected/actual evidence, tester, test date and environment are specified.
Release governance	Use severity/risk-based go/no-go criteria and require authorized defect waiver owner.	Unresolved critical supplier approval failure must block intended go-live in fictional decision model.
Test versus validation	Do not equate mock-system UAT to production computerized system validation.	Clearly state in-scope regulated uses require additional requirements/risk controls/evidence if applicable.

B. Applicable regulatory / guidance boundaries

Review objective	2026 reviewer correction / expectation	Verification evidence
Scope	Fictional commercial supplier master/ERP migration, not a validated medical-device QMS or clinical EDC.	Do not label SAP-like mock UAT as an FDA validation or actual system access test.
Evidence	Requirements -> source mapping -> expected/actual result -> defect -> retest -> acceptance owner.	Use synthetic IDs, revisioned mappings and traceable test executions.
Conditional FDA applicability	Part 11 if predicate electronic records; 2026 QMSR and device CSA only if used for in-scope device production/QMS.	A business test pass never independently proves GxP compliance or authorized production deployment.

C. Evidence and sign-off boundaries

Status: Editorial second-pass reviewed; technical procedure not executed; company-specific SOP approval not obtained.

All tests, screenshots, users, suppliers, dates, IDs, incident observations, performance metrics and signatures in the demonstration are synthetic.

Next practitioner action: confirm source applicability for the actual jurisdiction and product; conduct SME/user testing and accessibility review; update controlled revision and approval fields.

No color, watermark, revision number, PDF export or reference link by itself demonstrates regulatory compliance.
