ERP Data Quality Reviewer: End-User Guide & Knowledge Base

Document ID	UG-ERP-005
Revision	1.0
Status	ILLUSTRATIVE — NOT APPROVED FOR OPERATIONS
Audience	Procurement, QA, Regulatory and Operations Reviewers
Information classification	Synthetic portfolio exercise; no employer or customer data

Scenario: A fictional business consolidates five legacy datasets into a new ERP staging environment. All systems, transactions, personnel and results in this document are synthetic.

1. Who this guide is for

Business reviewers who need to inspect staged records, compare source evidence, route discrepancies and track items to resolution. Users must have an authorized account for the hypothetical AtlasERP staging portal. This is a mock workflow and cannot be used to operate a real ERP.

2. Before you start

- Have your approved role/access and correct staging environment name.
- Have the source extract identifier, the relevant vendor/material/order ID and the current mapping version.
- Never place live personal, financial, health, or proprietary supplier information in the portfolio sample.

3. Review a vendor record

- 1. Navigate to Data Quality > Supplier Review, then select the test batch from the batch selector.
- 2. Search by vendor identifier such as VND-0042 and confirm the source system is LEG-A.
- 3. Open the Lineage panel; inspect the original vendor code and approval status without changing values.
- 4. Compare approval evidence and controlled supplier status. If evidence is missing, select Flag Exception instead of Approve.
- 5. Record mapping ID MAP-02, the discrepant field, observed value, expected value, and supporting non-sensitive evidence.
- 6. Assign the item to Procurement and note the decision needed. Revisit after the owner responds; do not self-approve an item outside your role.

4. Review material/vendor associations

- Open Material Review and locate MAT-0084.
- Confirm the vendor ID exists and is eligible in the approved vendor dataset.
- If the vendor is missing or blocked, open an exception, identify MAP-04 and route to QA/Procurement.
- Do not change source IDs to make referential validation pass. Keep the item quarantined until authorized data correction is completed.

5. Review order values

- Filter Orders by batch and currency; compare order count and total to the approved reconciliation report.
- For a discrepancy, confirm whether currency conversion was expected under the mapping. Do not invent an exchange rate.

- Record the source amount, target amount, variance, and Finance reviewer; send the issue to the designated owner.

6. Manage an exception

Status	Meaning	Allowed next action
OPEN	Needs owner investigation	Request evidence, assign due date
IN REVIEW	Owner assessing source/target values	Provide clarification; do not finalize
READY FOR RETEST	Correction supplied in a tagged build	Execute linked test and attach evidence
CLOSED	Evidence accepted by authorized reviewer	Preserve history; no silent edits

In this project, EXC-003 and DEF-002 remain OPEN. Never mark a synthetic issue closed simply to make a dashboard appear complete.

7. Troubleshooting and frequently asked questions

Issue	First check	Escalate to
Supplier not visible	Correct batch and role filter	Procurement/Data Engineering
Numbers differ	Currency, mapping version, source totals	Finance/Data Engineering
Cannot approve	Role permissions and blocked status	Business Owner/Security
Unexpected duplicate	Same original ID across legacy systems	Data Governance
Dashboard count stale	Last refresh timestamp and applied filters	Reporting Owner

8. Access, audit trail and safe handling

Use least-privilege access and document all decisions in approved systems. The mock portal description assumes change history, but implementation is not demonstrated. A real deployment would require system qualification and organizational access policies.

9. Quick reference checklist

- Confirm batch/build, source key, target key, mapping version, expected status and supporting source evidence.
- If a discrepancy exists: create exception, assign responsible owner, provide evidence, and track to retest.
- If unsure: stop and consult the source owner rather than bypassing a control.

10. Feedback and future revisions

A knowledge-base article should change when users reveal unclear tasks. Suggested review metric: count repeat clarifications by topic and revise the relevant step. Any revisions require technical accuracy review and a documented changelog.

REGULATORY / TECHNICAL REVIEW ADDENDUM — November 2026

Independent technical writing portfolio enhancement. Additional validation gates and examples are illustrative, not authorized production instructions. Regulated applicability varies by product, process, record and organization.

Task-based user instruction: verify supplier status

Before starting, confirm that your user role permits review, obtain a synthetic receipt ID, open the authorized application and verify the system banner/environment. Search by exact supplier ID rather than approximate name.

Open record details, confirm status and effective dates, compare approved material association and specification revision, then select an outcome: MATCHED, NEEDS REVIEW or BLOCKED.

If source-to-target data disagree, do not overwrite the authoritative source. Record the discrepancy, select the responsible owner and attach the permitted evidence reference. Escalate supplier approval concerns to Quality/Procurement; route system defects to application support.

Common errors and documentation feedback loop

“Vendor not found”: verify exact source ID and crosswalk version; if absent, file a mapping exception. “Supplier inactive”: confirm approval history and stop the dependent process. “Spec revision mismatch”: open governed change review; do not manually force an approved code.

For knowledge base improvements, record the user question, relevant screen/process version, author, SME validation result and next revision. Do not copy real personal data or credentials into public troubleshooting examples.

Accessibility: use heading structure, numbered steps, meaningful link labels and readable black-on-white body text; no operational status should rely exclusively on blue/red/green color.

Document-specific reference basis and status

ISO/IEC/IEEE 26514:2022 information for software users (full URL in portfolio review report)

IEC/IEEE 82079-1:2019 instructions for use (full URL in portfolio review report)

FDA Part 11 scope and application guidance (full URL in portfolio review report)

W3C WCAG 2.2 color use guidance (full URL in portfolio review report)

Status: technical/editorial review against publicly available references completed at a portfolio-example level; no licensed-standard full-text conformance audit, live environment testing, site QA approval or legal certification performed.

Appendix: November 2026 standards and documentation applicability review

PUBLIC SYNTHETIC PORTFOLIO SAMPLE — This appendix records source-checking and editorial scope boundaries. It does not make the fictional organization regulated, certify a system, or replace actual company policies and competent quality/legal review.

ERP / UAT regulatory applicability and software test-evidence review

- Confirm each source-to-target mapping has an owner, approved transformation rule, exception disposition and independent tie-out. Synthetic test failures must remain OPEN until a documented rerun passes.
- Separate functional UAT from regulated computerized-system validation: business acceptance is not evidence of 21 CFR Part 11 compliance or FDA-required validation.
- 21 CFR Part 11 may become relevant only if the mapped environment maintains qualifying electronic records/signatures within predicate-rule scope; evaluate access, audit trail, record retention and copies when applicable.
- For medical-device production/QMS software, FDA's February 2026 Computer Software Assurance final guidance provides risk-based recommendations and QMSR became effective February 2, 2026; do not impose these onto a general commercial SAP migration.
- NIST access control, change management and audit logging offer voluntary security reference points for privileged ERP access, defect fix approvals and evidence retention.
- Technical writing QA: include acceptance criteria, reproducible steps, observed versus expected result, severity basis, defect owner, approval and version; never infer that an unresolved hypothetical defect passed.

Verified against published authoritative source pages as of November 2, 2026. No proprietary standards were audited clause-by-clause. Actual application must be assessed based on product, system use, region, and record type. Proposed procedures have not been executed in a production environment.

Independent second-pass document review | November 2, 2026

REVIEWED PORTFOLIO DEMONSTRATION — this appendix records a document-specific editorial and source-scope check. The main procedure and forms are fictional and not approved for production, executed testing or regulated use. Original source versions are retained as editable files in this portfolio.

A. Document-specific findings and checks

Review objective	2026 reviewer correction / expectation	Verification evidence
Audience	Distinguish vendor maintenance user, QA reviewer, approver and support personnel.	Instructions include access prerequisites and expected permissions.
Accuracy	Describe navigation using fictional app screens, fields and example IDs only.	Label UI as simulated; avoid implying access to employer SAP production screens.
Escalation / documentation	Users identify wrong vendor, duplicate, restricted data and incomplete approvals and log an exception.	Include what NOT to do: no unauthorized override or direct production database fix.

B. Applicable regulatory / guidance boundaries

Review objective	2026 reviewer correction / expectation	Verification evidence
Scope	Fictional commercial supplier master/ERP migration, not a validated medical-device QMS or clinical EDC.	Do not label SAP-like mock UAT as an FDA validation or actual system access test.
Evidence	Requirements -> source mapping -> expected/actual result -> defect -> retest -> acceptance owner.	Use synthetic IDs, revisioned mappings and traceable test executions.
Conditional FDA applicability	Part 11 if predicate electronic records; 2026 QMSR and device CSA only if used for in-scope device production/QMS.	A business test pass never independently proves GxP compliance or authorized production deployment.

C. Evidence and sign-off boundaries

Status: Editorial second-pass reviewed; technical procedure not executed; company-specific SOP approval not obtained.

All tests, screenshots, users, suppliers, dates, IDs, incident observations, performance metrics and signatures in the demonstration are synthetic.

Next practitioner action: confirm source applicability for the actual jurisdiction and product; conduct SME/user testing and accessibility review; update controlled revision and approval fields.

No color, watermark, revision number, PDF export or reference link by itself demonstrates regulatory compliance.

D. Authoritative primary-source references
